PIPERIDINE DERIVATIVES USEFUL AS CCR5 ANTAGONISTS**10 BACKGROUND**

The present invention relates to piperidine derivatives useful as selective CCR5 antagonists, pharmaceutical compositions containing the compounds, and methods of treatment using the compounds. The invention also relates to the use of a combination of a CCR5 antagonist of 15 this invention and one or more antiviral or other agents useful in the treatment of Human Immunodeficiency Virus (HIV). The invention further relates to the use of a CCR-5 antagonist of this invention, alone or in combination with another agent, in the treatment of solid organ transplant rejection, graft v. host disease, arthritis, rheumatoid arthritis, inflammatory 20 bowel disease, atopic dermatitis, psoriasis, asthma, allergies or multiple sclerosis.

The global health crisis caused by HIV, the causative agent of Acquired Immunodeficiency Syndrome (AIDS), is unquestioned, and while recent advances in drug therapies have been successful in slowing the 25 progression of AIDS, there is still a need to find a safer, more efficient, less expensive way to control the virus.

It has been reported that the CCR5 gene plays a role in resistance to HIV infection. HIV infection begins by attachment of the virus to a target cell membrane through interaction with the cellular receptor CD4 and a 30 secondary chemokine co-receptor molecule, and proceeds by replication and dissemination of infected cells through the blood and other tissue. There are various chemokine receptors, but for macrophage-tropic HIV, believed to be the key pathogenic strain that replicates *in vivo* in the early 35 stages of infection, the principal chemokine receptor required for the entry of HIV into the cell is CCR5. Therefore, interfering with the interaction between the viral receptor CCR5 and HIV can block HIV entry into the cell. The present invention relates to small molecules which are CCR5 antagonists.

- 2 -

CCR-5 receptors have been reported to mediate cell transfer in inflammatory diseases such as arthritis, rheumatoid arthritis, atopic dermatitis, psoriasis, asthma and allergies, and inhibitors of such receptors are expected to be useful in the treatment of such diseases, and in the

5 treatment of other inflammatory diseases or conditions such as inflammatory bowel disease, multiple sclerosis, solid organ transplant rejection and graft v. host disease.

Related piperidine derivatives which are muscarinic antagonists useful in the treatment of cognitive disorders such as Alzheimer's disease

10 are disclosed in US patents 5,883,096; 6,037,352; 5,889,006; 5,952,349; and 5,977,138.

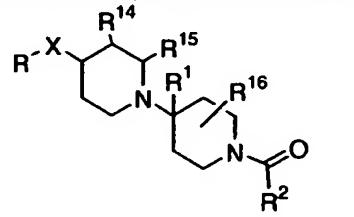

A-M. Vandamme et al., *Antiviral Chemistry & Chemotherapy*, 9:187-203 (1998) disclose current clinical treatments of HIV-1 infections in man including at least triple drug combinations or so-called Highly Active

15 Antiretroviral Therapy ("HAART"); HAART involves various combinations of nucleoside reverse transcriptase inhibitors ("NRTI"), non-nucleoside reverse transcriptase inhibitors ("NNRTI") and HIV protease inhibitors ("PI"). In compliant drug-naive patients, HAART is effective in reducing mortality and progression of HIV-1 to AIDS. However, these multidrug therapies do

20 not eliminate HIV-1 and long-term treatment usually results in multidrug resistance. Development of new drug therapies to provide better HIV-1 treatment remains a priority.

pyridyl and 4-pyridyl. Typical 6-membered heteroaryl groups are pyridyl, pyrimidinyl, pyrazinyl, pyridazinyl and the N-oxides thereof. For 5-membered heteroaryl rings, carbon atoms can be substituted by R¹⁰ or R¹¹ groups. Typical 5-membered heteroaryl rings are furyl, thienyl, pyrrolyl, 5 thiazolyl, isothiazolyl, imidazolyl, pyrazolyl and isoxazolyl. 5-Membered rings having one heteroatom can be joined through the 2- or 3- position; 5-membered rings having two heteroatoms are preferably joined through the 4-position. Bicyclic groups typically are benzo-fused ring systems derived from the heteroaryl groups named above, e.g. quinolyl, phthalazinyl, 10 quinazolinyl, benzofuranyl, benzothienyl and indolyl.

Preferred points of substitution for 6-membered heteroaryl rings at R² are described above. When R² is a 5-membered heteroaryl group, the R¹⁰ and R¹¹ substituents are preferably attached to carbon ring members adjacent to the carbon joining the ring to the rest of the molecule, and R¹¹ 15 is preferably alkyl; however, if a heteroatom is adjacent to the carbon joining the ring to the rest of the molecule (i.e., as in 2-pyrrolyl), R¹⁰ is preferably attached to a carbon ring member adjacent to the carbon joining the ring to the rest of the molecule.

Halogen represents fluoro, chloro, bromo and iodo.

20 Fluoro(C₁-C₆)alkyl represents a straight or branched alkyl chain substituted by 1 to 5 fluoro atoms, which can be attached to the same or different carbon atoms, e.g., -CH₂F, -CHF₂, -CF₃, F₃CCH₂- and -CF₂CF₃.

25 Certain CCR5 antagonist compounds of the invention may exist in different isomeric (e.g., enantiomers, diastereoisomers and atropisomers) forms. The invention contemplates all such isomers both in pure form and in admixture, including racemic mixtures.

30 Certain compounds will be acidic in nature, e.g. those compounds which possess a carboxyl or phenolic hydroxyl group. These compounds may form pharmaceutically acceptable salts. Examples of such salts may include sodium, potassium, calcium, aluminum, gold and silver salts. Also contemplated are salts formed with pharmaceutically acceptable amines such as ammonia, alkyl amines, hydroxyalkylamines, N-methylglucamine and the like.

35 Certain basic compounds also form pharmaceutically acceptable salts, e.g., acid addition salts. For example, the pyrido-nitrogen atoms may form salts with strong acid, while compounds having basic substituents such as amino groups also form salts with weaker acids. Examples of suitable acids for salt formation are hydrochloric, sulfuric, phosphoric,

acetic, citric, oxalic, malonic, salicylic, malic, fumaric, succinic, ascorbic, maleic, methanesulfonic and other mineral and carboxylic acids well known to those in the art. The free base forms may be regenerated by treating the salt with a suitable dilute aqueous base solution such as dilute aqueous NaOH, potassium carbonate, ammonia and sodium bicarbonate. The free base forms differ from their respective salt forms somewhat in certain physical properties, such as solubility in polar solvents, but the acid and 10 base salts are otherwise equivalent to their respective free base forms for purposes of the invention.

All such acid and base salts are intended to be pharmaceutically acceptable salts within the scope of the invention and all acid and base salts are considered equivalent to the free forms of the corresponding 15 compounds for purposes of the invention.

- 17 -

Scheme 1

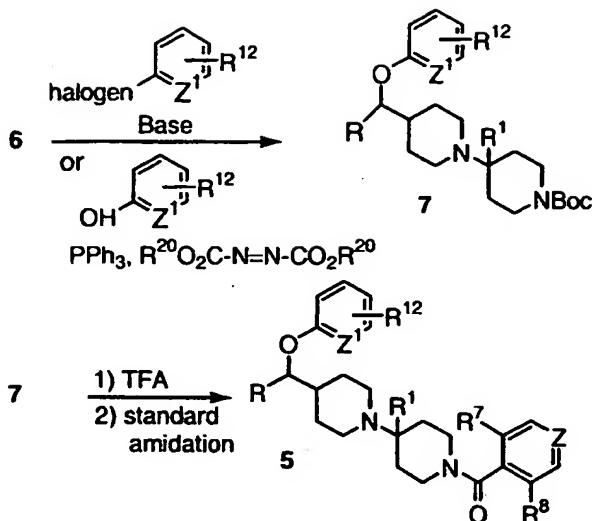

Compounds of formula 3, wherein R, R⁷ and R⁸ are as defined for formula I, Z is CH or N, and R¹ is an alkyl group such as methyl were prepared as depicted in Scheme 1. Ketone 1, the synthesis of which was described in WO98/05292, was subjected to standard amidation with 10 ArCOOH, EDCI or DEC, and HOBT, or ArCOCl, wherein Ar is R⁷, R⁸- substituted phenyl or pyridyl, followed by reduction with NaBH₄ to obtain 3. Derivatization of the free hydroxyl moiety with alkyl halides, acyl chlorides (R³COCl), alkyl chloroformates (ClCOOR³) and isocyanides (O=C=NR³) afforded ethers 4a, esters 4b, carbonates 4c, and carbamates 4d, 15 respectively, wherein R³ is a lower alkyl group. The aryloxy compounds, 5, were obtained after condensation of the hydroxyl 3 with phenyl or pyridyl halides in the presence of a base.

Scheme 2

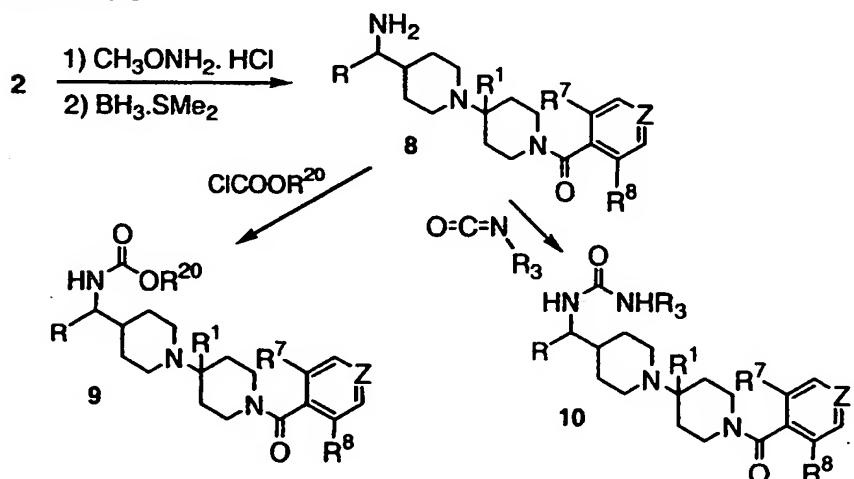

- 18 -

Alternatively, compounds of formula 5 can be prepared by reduction of the N-Boc ketone 1a to the alcohol 6 first, followed by functionalization of the free hydroxyl group with a halogen-substituted aryl in the presence of a base as shown in Scheme 2, or by a hydroxy-substituted aryl or heteroaryl (wherein Z¹ is as defined in Scheme 1) in the presence of PPh₃ and an azodicarboxylate of the formula R¹⁹O₂C-N=N-CO₂R²⁰, wherein R²⁰ is C₁-C₆ lower alkyl. Removal of the Boc protecting group and conversion to the amide is performed as in Scheme 1. 5 **Scheme 4**

Preparation of chiral analogs was performed through chemical resolution. The alcohol 6 was coupled with a chiral Boc-protected amino acid to obtain diastereoisomers 11a and 11b which were separated by chromatography. The chiral auxiliary was then removed with NaOH for each diastereoisomer and the same sequence of reactions described in Scheme 2 was carried out on each individual enantiomer to obtain compounds 12a and 12b.

Oximes of formula I or II wherein X is $\text{C}=\text{NOR}^4$ are prepared from the corresponding ketones from any of several methods known to those skilled in the art.

Scheme 5:

The resulting mixture of Z- and E-O-substituted oximes **13** can be separated or the mixture carried through and separated at the end. The BOC protecting group is removed by treatment with an acid such as aqueous HCl or trifluoroacetic acid, and the resulting amine is coupled to an acid under standard conditions to obtain a compound of formula I or II.

Scheme 6:

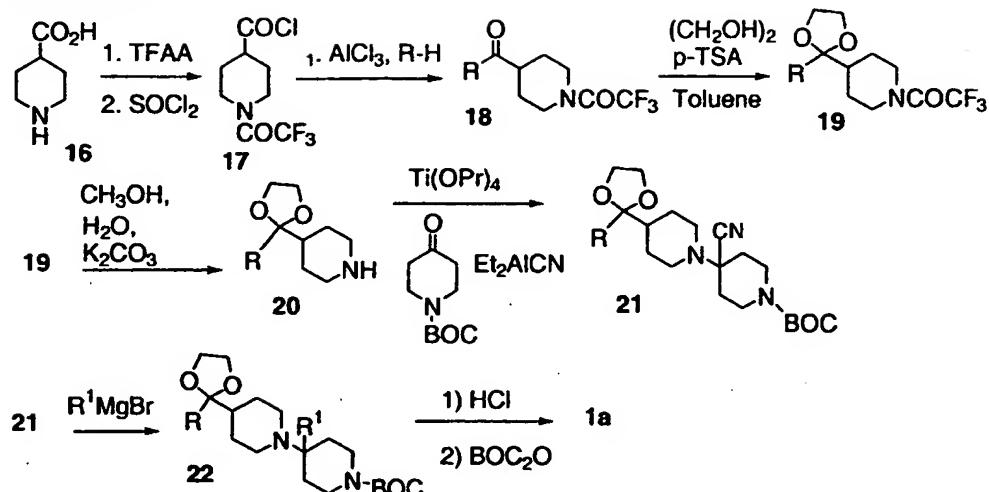

Alternatively, the ketone **1a** can be treated with HONH₂·HCl under similar conditions to yield, after separation, the E- and Z-oximes. Each 15 oxime is then treated with a base such as potassium hexamethyldisilazide in a suitable solvent such as DMF followed by treatment with an alkylating agent, e.g., CH₃I, dimethylsulfate, CH₃CH₂I, trifluoroethyl triflate or similar electrophiles, to yield the desired O-substituted oxime.

The ketone starting material of formula **1a** can be prepared by 20 known methods as shown in Schemes 7 and 8.

- 21 -

Scheme 7:

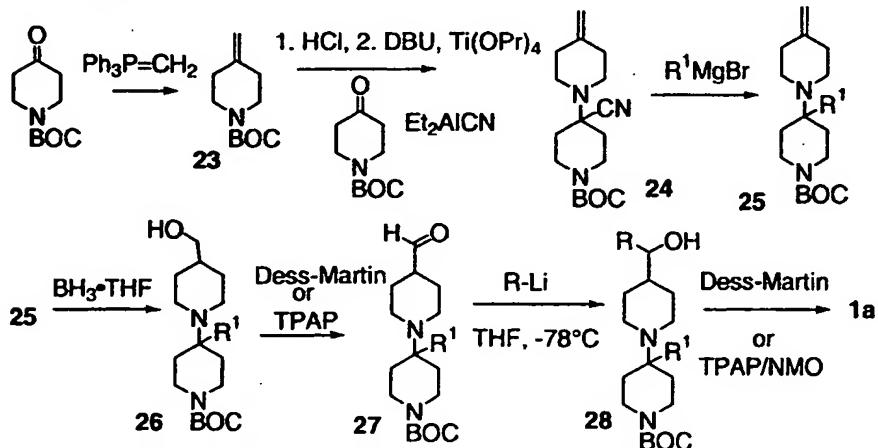

In Scheme 7, Friedel-Crafts condensation of N-trifluoroacetyl-

5 isonipecotoyl chloride **17** and an aromatic group R-H in the presence of a suitable catalyst such as AlCl_3 and optionally in a solvent such as CH_2Cl_2 yields a ketone **18** which is converted to its ethylene ketal **19** under standard conditions. The N-trifluoroacetyl group is removed and the resulting free amine **20** is treated with N-BOC-piperidine-4-one in the presence of a dehydrating agent such as titanium isopropoxide followed by treatment with diethylaluminum cyanide to give an aminonitrile **21**. The aminonitrile is treated with a grignard reagent ($\text{R}^1\text{Mg}-\text{halide}$) such as CH_3MgBr or vinylmagnesium bromide to give the alkylated product **22**. The ketal is removed by treatment with aqueous acid followed by re-protection under standard conditions using BOC anhydride to give **1a**.

10

15

20 (Chen et al, *Tetrahedron Lett.*, 37, 30 (1996), 5233-5234), is transformed to

- 22 -

intermediate 25 by analogy to the procedure described in Scheme 7. 25 is converted to alcohol 26 by hydroboration/oxidation. Alcohol 26 is treated with a suitable oxidant such as a mixture tetrapropylammonium perruthenate (TPAP) and N-methylmorpholine N-oxide (NMO) to give 5 aldehyde 27. The aldehyde is treated with an aryllithium reagent in a suitable solvent such as ether or THF and the resulting alcohol 28 is treated with an oxidizing agent such as Dess-Martin periodinane or TPAP/NMO to give the desired ketone.

The schemes are exemplified by processes wherein R and R^{19} are each phenyl and wherein R is phenyl and R^{19} is CF_3 -phenyl, respectively, but the general procedures apply to other R and R^{19} groups.

15 **Scheme 9**

N-BOC-4-piperidone is treated with CBr_4 to obtain the di-bromo compound of formula 44, which is then treated with phenylboronic acid to obtain the BOC-protected diphenylmethylene-piperidine of formula 45. The 20 methylene bond is reduced using standard conditions to obtain the BOC-protected diphenylmethyl-piperidine of formula 46, the BOC group is removed and the amine of formula 47 is treated as described for compounds 20-22 of Scheme 7, the BOC group is removed by treatment with TFA, and the resultant amine subjected to a standard amidation 25 procedure, e.g., treatment with a reagent R^2COOH and coupling agents such as EDCI, HOBT and a base, to obtain the compounds of formula 48.

Scheme 10

N-BOC-4-piperidone is treated with a reagent such as diethyl

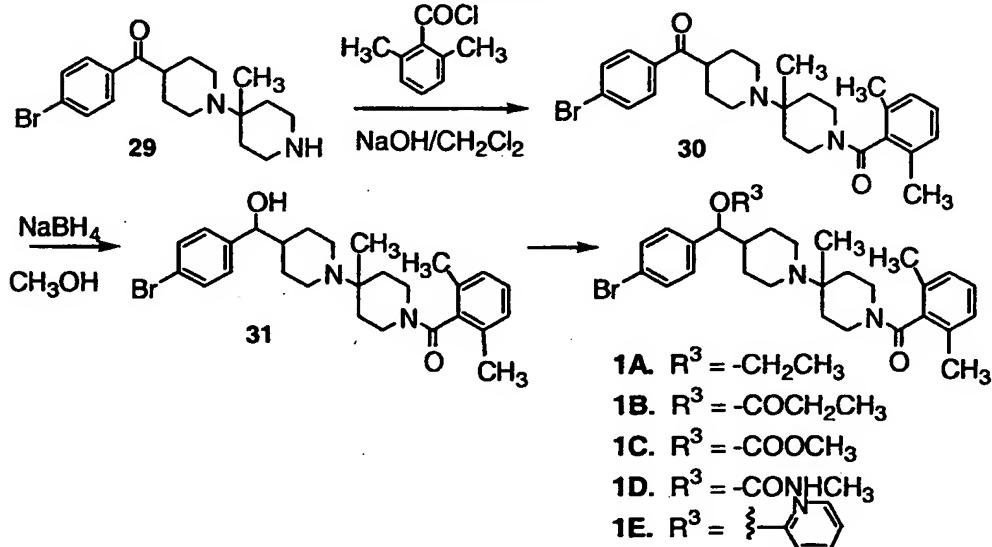

- 5 benzylphosphonate to obtain the phenylmethylene-piperidine of formula 49, which is then brominated to obtain the bromophenylmethylene-piperidine of formula 50. The BOC protecting group is removed using standard conditions, e.g., treatment with TFA, to obtain amine 51, and the amine 51 is treated as described for compounds 20-22 of Scheme 7 to obtain the
- 10 aminonitrile 52, then the protected amine 53. The amine 53 is treated with a reagent such as 4-CF₃-phenylboronic acid to obtain compound 54 and the methylene bond is reduced using standard conditions to obtain racemic 55. The BOC group is removed by treatment with TFA, and the resultant amine subjected to a standard amidation procedure, e.g., treatment with a
- 15 reagent R²COOH and coupling agents such as EDCI, HOBT and a base, to obtain the racemic compounds of formula 56.

5 A solution of ketone 32 (0.60 g, 1.29 mmol) and NaBH₄ (60 mg, 1.59 mmol) in CH₃OH (5 ml) was stirred overnight at RT. The reaction mixture was poured into 0.1 N NaOH, extracted with CH₂Cl₂, dried over Na₂SO₄, and concentrated to give 33 (0.60 g, 100%), as a white foam.

10 To a solution of alcohol 33 (543 mg, 1.2 mmol) in anhydrous toluene (4 ml) was added KHMDS, 0.5 N in toluene (2.6 ml, 1.30 mmol) followed, 15 min. later, by 2-bromopyridine (125 μ l, 1.30 mmol). The reaction was heated 5 h at 60 °C, cooled to RT and poured into 5% aqueous NaHCO₃ (25 ml). Extraction with CH₂Cl₂, drying over Na₂SO₄ and concentration afforded an oil which was purified by flash chromatography over silica gel (eluting with CH₂Cl₂/AcOEt/Et₃N 50:50:1 to 40:60:1) to yield 34a (310 mg, 49%), as a yellow foam.

Example 3

To a solution of ketone 30 (1.5 g, 3.22 mmol) in CH_3OH (50 ml) was 5 added sodium acetate (5.0 g, 47 mmol) and *O*-Methyl hydroxylamine hydrochloride (3.26 g, 47 mmol), and the solution was stirred at RT for 24 h. The resulting mixture was then poured into aqueous NaOH and extracted with CH_2Cl_2 . The combined extracts were dried, concentrated and chromatographed to yield 1.50 g (94%) of oxime 36, as a mixture of E 10 and Z isomers.

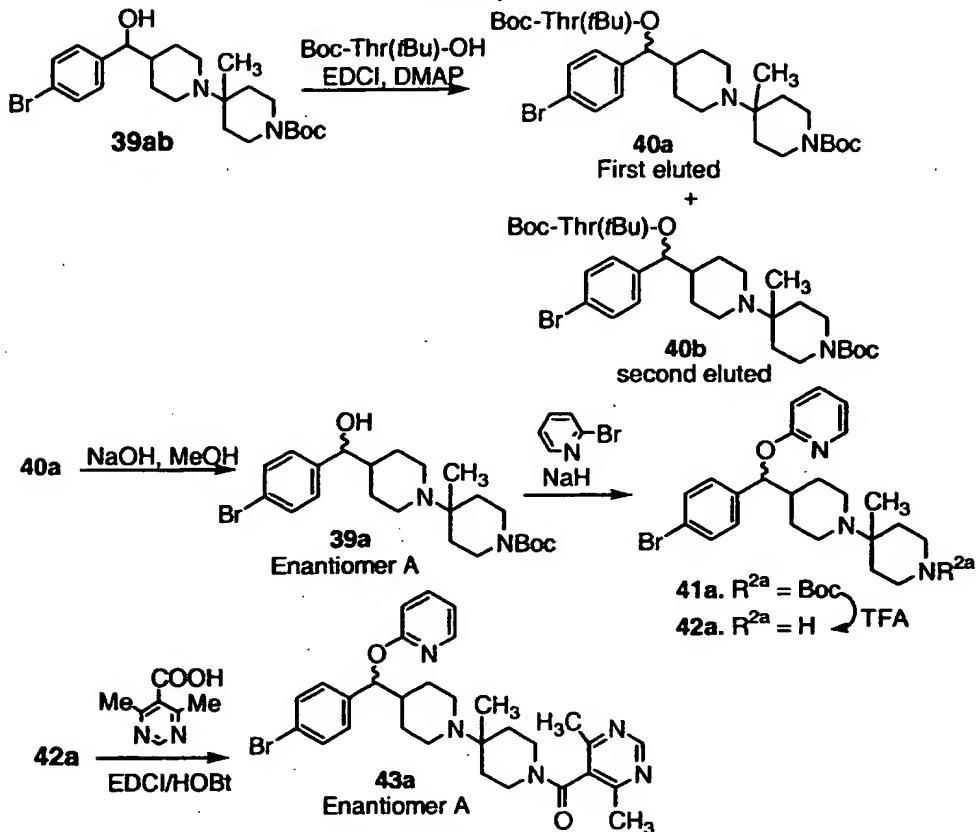

To a stirred solution of oxime 36 (0.200 g, 0.380 mmol) in THF (5 ml) was added $\text{BH}_3 \cdot \text{THF}$ (1.0 M solution in THF) at 0 °C and the solution was then warmed to RT and stirred for 1 h. The reaction mixture was then cooled to 0°C and a solution of 1N KOH in CH_3OH (5 ml) was added. The 15 reaction was warmed slowly to 60°C for 2 h, cooled to RT, quenched with water and extracted with CH_2Cl_2 . Combined organic layers were concentrated and chromatographed over silica gel (eluting with 20% EtOH/EtOAc) to afford 0.100 g (50%) of amine 37.

To a stirred solution of amine 37 (0.015 g, 0.030 mmol) was added 20 pyridine (0.5 ml) and ClCOOCH_3 (0.25 ml), and the solution was stirred overnight. It was then poured into water, extracted with EtOAc, dried, concentrated and purified by preparative chromatography to give 0.010 g of desired product 38: $^1\text{H-NMR}$ (300 MHz, CDCl_3) δ 7.45 (d, 2H), 7.05-7.12 (m, 3H), 6.95 (d, 2H), 4.95 (m, 1H), 4.45 (m, 1H), 4.15 (m, 1H), 3.62 (s,

5 A solution of alcohol **39ab** (660 mg, 1.41 mmol), **Boc-Thr(t-Bu)-OH** (413 mg, 1.50 mmol), **DEC** (290 mg, 1.50 mmol) and **DMAP** (190 mg, 1.55 mmol) in anhydrous **CH₂Cl₂** (5 ml) was stirred overnight at RT. The reaction mixture was poured into aqueous saturated **NaHCO₃**, extracted with **CH₂Cl₂**, and dried over **Na₂SO₄**. The residue obtained after

10 concentration of the solvent was subjected to flash chromatography over silica gel (eluting with **CH₂Cl₂/acetone**, 9:1) to afford, in order of elution: (i) first **40a** (391 mg, 38%), as a white foam; (ii) second **40b** (391 mg, 38%), as a white foam.

To a solution of diastereoisomer **40a** (391 mg, 0.54 mmol) in **CH₃OH**

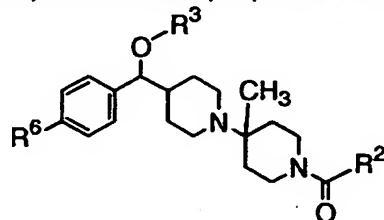

15 (3 ml) was added **NaOH** (110 mg, 2.75 mmol; 5 equiv.) and the solution was stirred at 65 °C for 3 h. The final mixture was then poured into aqueous 0.1 N **NaOH** and extracted with **CH₂Cl₂** to yield **39a** (Enantiomer A) (246 mg, 98%) as a white foam. (Following the same procedure, **40b** gave **39b** (Enantiomer B). **40a** gives **43a** (Enantiomer A) and **40b** gives **43b** (Enantiomer B).)

A solution of alcohol **39a** (210 mg, 0.45 mmol), NaH 60% in mineral oil (23 mg, 0.96 mmol), and 2-bromopyridine (60 μ l; 0.62 mmol) in anhydrous DMF (1.5 ml) was stirred 2 h at 75 °C. The reaction mixture was poured into aqueous sat'd NaHCO₃, extracted with CH₂Cl₂, dried over 5 Na₂SO₄ and purified by flash chromatography over silica gel (eluting with CH₂Cl₂/AcOEt/Et₃N, 60:40:0.5 to 40:60:0.5) to afford **41a** (143 mg, 59%).

Example 5

5 1) Trifluoroacetic anhydride (TFAA) (300 ml) is added to isonipecotic acid (96 g) at 0°C and the reaction mixture is heated at reflux for 4h. Excess TFAA is removed under vacuo, the reaction mixture is taken up in EtOAc, washed with water and concentrated to give 160 g of the amide. 50 g of this amide is treated with SOCl₂ (300 ml) and the reaction mixture

10 heated at reflux overnight. Excess thionyl chloride is then removed under vacuo to give 54 g of the acid chloride.

2) AlCl₃ (11g) is added slowly to a solution of the product of step 1 (10 g) in bromobenzene (40 ml) at ambient temperature and the reaction mixture is heated at reflux for 4 h. It is then cooled and poured into a

15 mixture of conc. HCl and ice, and the product is extracted with EtOAc. The organic layer is separated and washed with water, half saturated NaHCO₃ solution and concentrated to give 16.21 g of the desired ketone.

3) The product of step 2 (16.21 g) is dissolved in toluene (200 ml) containing ethylene glycol (25 ml) and p-toluenesulfonic acid (0.5 g). The

20 reaction mixture is heated at reflux with azeotropic removal of water until no further water is collected. The reaction mixture is concentrated to give 17.4 g of the desired ketal.

4) The crude product of step 3 (17.4 g) is dissolved in CH₃OH (100ml) and to this is added water (25 ml) and K₂CO₃ (12 g) and the reaction mixture is stirred at ambient temperature overnight. The reaction mixture is diluted with water and extracted with EtOAc. The organic layer is

5 separated, washed with water and brine, and concentrated to give 12.55 g of the desired amine.

5) To a stirred solution of the product of step 4 (7.2 g, 23 mmol) and N-BOC-piperidine-4-one (4.8 g, 24 mmol) in 1,2-dichloroethane (20 ml) is added titanium isopropoxide (6.7 ml, 32.3 mmol) and the mixture is stirred

10 for 12 h at RT. The reaction mixture is concentrated and a 1.0 M solution of diethyl aluminium cyanide (35 ml) is added at RT and stirred for 3 h. The reaction mixture is then diluted with EtOAc, quenched with water (5 ml) and stirred for 2 h. The mixture is then filtered through celite and the resulting filtrate is concentrated and chromatographed with 30 % EtOAc/hexanes to

15 afford 7.3 g (63%) of the desired cyanide.

6) To a stirred solution of the product of step 5 (7.3 g, 14.03 mmol) in THF (100 ml) is added a 3.0M solution CH₃MgBr in Et₂O (14.0 ml, 42 mmol) at RT and the mixture is stirred for 2 h. The reaction mixture is then quenched with saturated aqueous NH₄Cl and extracted with CH₂Cl₂. The

20 extracts are concentrated to afford 7.0 g of desired methylated compound.

The mixture is then cooled to 0 °C and diethylaluminum cyanide, 1 N in toluene (260 ml, 0.26 mol) is added with vigorous stirring. The reaction is allowed to warm to RT and stirred an additional 3 h, after which are added CH₂Cl₂ (300 ml), EtOAc (300 ml), and

B) Preparation of title compounds of Example 6.

1) A solution of 1-bromo-4-(trifluoromethoxy)-benzene (4.20 ml, 28.0 mmol) in anhydrous THF (100 mL) is cooled to -78 °C and n-BuLi 2.5 N in hexanes (11.2 ml, 28.0 mmol) is added via syringe. The reaction mixture is allowed to warm to -50 °C for 10 min, cooled to -78 °C, and a solution of aldehyde 27 (6.20 g, 20.0 mmol) in anhydrous THF (15 ml) is added dropwise. After stirring 30 min at -78 °C, then 30 min at -20 °C, the solution is poured into half-brine and extracted with CH₂Cl₂ (3 x 100 ml). Combined organic layers are dried over Na₂SO₄, and concentrated to give 8.85 g (94%) of an alcohol as a yellow oil.

2) To a solution of the product of step 1 (8.85 g, 39.3 mmol) in CH_2Cl_2 (100 ml) at 0 °C is added Dess-Martin periodinane (19.70 g, 2.5 equiv.) and the reaction mixture is stirred 2 h at RT. An additional 8.0 g of Dess-Martin periodinane is added and the reaction is stirred for an additional

5 4 h. The solution is poured into a 1:1 mixture of aqueous saturated NaHCO_3 and aqueous saturated $\text{Na}_2\text{S}_2\text{O}_3$ (200 ml), stirred 10 min, extracted with CH_2Cl_2 , and dried over Na_2SO_4 . The residue obtained after concentration of the solvents is purified by flash chromatography over silica gel (eluting with hexanes/EtOAc, 7:3) to yield 5.48 g (63%) of the ketone as

10 a yellow oil.

3) A solution of the product of step 2 (2.85 g, 6.05 mmol), $\text{HONH}_2\text{-HCl}$ (2.08 g, 30 mmol), and AcONa (2.46 g, 30 mmol) in EtOH (50 mL) is heated at reflux under N_2 for 4 h. After evaporation of the solvent, the residue is taken up in aqueous 0.1 N NaOH and extracted with CH_2Cl_2 .

15 15 The residue obtained after evaporation of the solvents is subjected to flash chromatography over silica gel, to afford first the E-hydroxime (eluting with CH_2Cl_2 /EtOAc, 7:3; 0.84 g; 29%), then the Z-hydroxime (eluting with CH_2Cl_2 /EtOAc 1:1; 1.10 g; 37%), both products as white solids.

(pH = 11). The Et₂O layer was dried over MgSO₄, filtered and evaporated to give the desired product as a yellow liquid (64.7 g) in 65% yield, which was used directly in the next step.

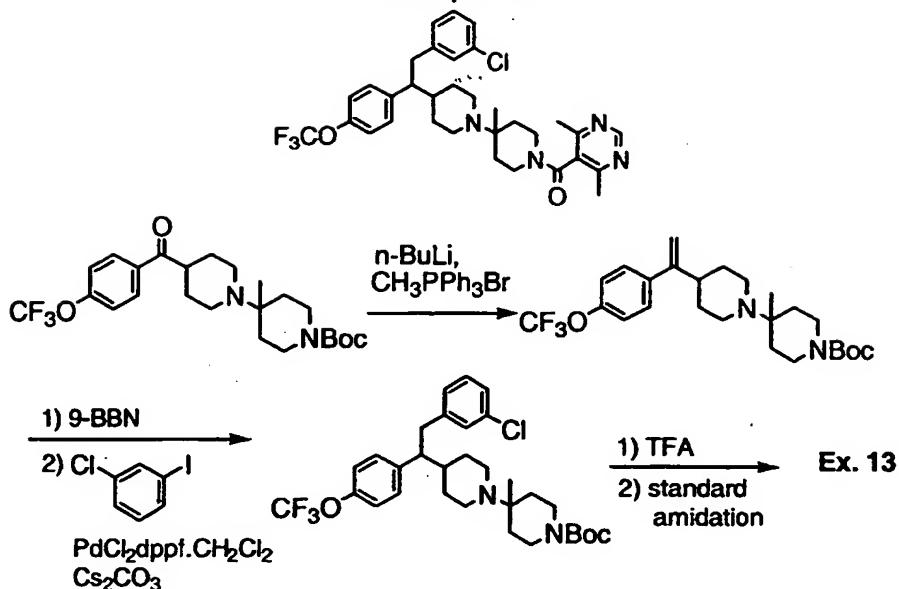

Step 2: The product of step 1 (64.2 g), sodium ethoxide in ethanol

5 (commercial solution; 21 wt%; 113 g) and formamidine acetate (36.2 g) were mixed together at RT. After refluxing for 4 h, the mixture was cooled to RT, the resulting precipitate was filtered off and the ethanol was removed under vacuum. The resulting liquid was partitioned between water and CH₂Cl₂ and the aqueous layer was extracted with CH₂Cl₂ (3 x 150 ml). The CH₂Cl₂ extracts were dried over MgSO₄, filtered and evaporated to give a dark crude liquid (50.7 g) which was purified by silica gel chromatography (980 g; 4:1 hexanes:EtOAc as eluant). After evaporation of the appropriate fractions, the desired product (28.5 g) was isolated in 46% yield and used directly in the next step.

10 15 Step 3: The product of step 2 (28.1 g), NaOH (6.72 g), water (65 ml) and EtOH (130 ml) were mixed together at RT and heated at reflux for 1h. The resulting solution was cooled to RT and the volatile materials were removed in vacuo until a thick paste resulted. Water (20 ml) was added, the mixture was cooled to 0°C and conc. HCl (14.3 ml) was added dropwise with stirring. The resulting white precipitate was collected by filtration, washed with ice water (2 X 10 ml) and air dried with suction for 30 min. The resulting white solid was treated with toluene (2 x 20 ml), the solvent was removed in vacuo at 50°C and then dried under vacuum (1 mm Hg) for 18 h. The desired product (14.9 g) was isolated as a white solid in 63% yield, 25 mp: 176-178°C. Elemental analysis of C₇H₈N₂O₂: calc'd C 55.26%, H 5.30%, N 18.41%; found: C 55.13%, H 5.44%, N 18.18%.

The resulting mixture was stirred at RT for 5 min, cooled in an ice bath and the 30 precipitate formed was collected by filtration. The resulting solid was washed with ice water (2 X 5 ml) and dried as described above to give the product (4.68 g) as a cream colored solid to give a combined yield of 83%.

1) The dibromo-olefin (3.55 g, 10 mmol) and TFA (10 ml) were taken up in CH_2Cl_2 and stirred at 25 °C for 20 h. The solution was concentrated. The residue was partitioned between CH_2Cl_2 and 1 N NaOH. The aqueous layer was extracted with CH_2Cl_2 . The combined organic layers were dried (Na_2SO_4). Filtration and concentration gave the 2.4 g (94 %) of the free piperidine as a colorless oil. The free piperidine (2.41 g, 9.45 mmol) was treated sequentially with (a) N-Boc-4-piperidone/Ti(OiPr)₄, and (b) Et_2AlCN , to give the cyano-amine as described in Step 5 of Example 11.

5 2) The product of Step 1 and MeMgBr (16 ml, 3.0 M in Et_2O) were taken up in THF (30 ml) and stirred at 25 °C for 19 h. The solution was quenched with 1 N NaOH and EtOAc . The mixture was filtered (Celite). The aqueous layer was extracted with EtOAc , the combined EtOAc layers were washed with brine and dried (Na_2SO_4). Filtration and concentration gave a yellow oil. Purification via flash chromatography (6/1 hexanes/ EtOAc , SiO_2) gave 2.54 g (69 % from the free piperidine) of the vinyl bromide as a solid. m.p. (free base) 85-90 °C. HRMS (MH⁺) calcd. for $\text{C}_{18}\text{H}_{32}\text{O}_2\text{N}_2\text{Br}$, 387.1647; Found, 387.1638.

The solution was partitioned between EtOAc and H_2O . The aqueous layer was extracted with EtOAc , the combined EtOAc layers were washed with brine and dried (Na_2SO_4). Filtration and concentration gave a yellow oil. Purification via flash chromatography (3/1 to 1/1 hexanes/ EtOAc , SiO_2) gave 210 mg (89 %) of the phenyl substituted olefin as an oil. HRMS (MH⁺) calcd. for $\text{C}_{25}\text{H}_{36}\text{O}_2\text{N}_2\text{F}_3$, 453.2729; Found, 453.2728.

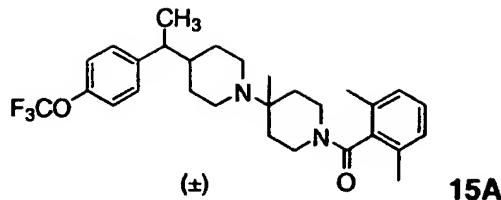

15 4) The product of Step 3 was hydrogenated as described in Step 3 of Example 11. The reduced product was deprotected and coupled to 2,6-dimethyl benzoic acid as described in Example 11, steps 7-8 to give the title compound as a yellow oil (37 mg, 55%). m.p. (HCl salt) 130-140 °C. 5 The following assays can be used to determine the CCR5 inhibitory and antagonistic activity of the compounds of the invention.

CCR5 Membrane Binding Assay:

A high throughput screen utilizing a CCR5 membrane binding assay identifies inhibitors of RANTES binding. This assay utilizes membranes 10 prepared from NIH 3T3 cells expressing the human CCR5 chemokine receptor which have the ability to bind to RANTES, a natural ligand for the receptor. Using a 96-well plate format, membrane preparations are incubated with ¹²⁵I-RANTES in the presence or absence of compound for one hour. Compounds are serially diluted over a wide range of 0.001ug/ml to 1 ug/ml and tested in 15 triplicates. Reaction cocktails are harvested through glass fiber filters, and washed thoroughly. Total counts for replicates are averaged and data reported as the concentration required to inhibit 50 percent of total ¹²⁵I-RANTES binding. Compounds with potent activity in the membrane binding assay are further characterized in secondary cell-based HIV-1 entry and 20 replication assays.

HIV-1 Entry Assay:

Replication defective HIV-1 reporter virions are generated by cotransfection of a plasmid encoding the NL4-3 strain of HIV-1 (which has been modified by mutation of the envelope gene and introduction of a 25 luciferase reporter plasmid) along with a plasmid encoding one of several HIV-1 envelope genes as described by Connor et al, *Virology*, **206** (1995), p. 935-944. Following transfection of the two plasmids by calcium phosphate precipitation, the viral supernatants are harvested on day 3 and a functional viral titer determined. These stocks are then used to infect U87 cells stably 30 expressing CD4 and the chemokine receptor CCR5 which have been preincubated with or without test compound. Infections are carried out for 2 hours at 37 °C, the cells washed and media replaced with fresh media containing compound. The cells are incubated for 3 days, lysed and luciferase

activity determined. Results are reported as the concentration of compound required to inhibit 50% of the luciferase activity in the control cultures.

HIV-1 Replication Assay:

This assay uses primary peripheral blood mononuclear cells or the 5 stable U87-CCR5 cell line to determine the effect of anti-CCR5 compounds to block infection of primary HIV-1 strains. The primary lymphocytes are purified from normal healthy donors and stimulated *in vitro* with PHA and IL-2 three days prior to infection. Using a 96-well plate format, cells are pretreated with drug for 1 hour at 37 °C and subsequently infected with an M-tropic HIV-1 10 isolates. Following infection, the cells are washed to remove residual inoculum and cultured in the presence of compound for 4 days. Culture supernatants are harvested and viral replication measured by determination of viral p24 antigen concentration.

Calcium Flux Assay:

15 Cells expressing the HIV coreceptor CCR5 are loaded with calcium sensitive dyes prior to addition of compound or the natural CCR5 ligand. Compounds with agonist properties will induce a calcium flux signal in the cell, while CCR5 antagonists are identified as compounds which do not induce 20 signaling by themselves but are capable of blocking signaling by the natural ligand RANTES.

GTP γ S Binding Assay (secondary membrane binding assay):

A GTP γ S binding assay measures receptor activation by CCR5 ligands. This assay measures the binding of 35 S labeled-GTP to receptor coupled G-proteins that occurs as a result of receptor activation by an appropriate ligand. 25 In this assay, the CCR5 ligand, RANTES, is incubated with membranes from CCR5 expressing cells and binding to the receptor activation (or binding) is determined by assaying for bound 35 S label. The assay quantitatively determines if compounds exhibit agonist characteristics by inducing activation of the receptor or alternatively antagonist properties by measuring inhibition of 30 RANTES binding in a competitive or non-competitive fashion.

Chemotaxis Assay:

The chemotaxis assay is a functional assay which characterizes the agonist vs. antagonist properties of the test compounds. The assay measures the ability of a non-adherent murine cell line expressing human 35 CCR5 (BaF-550) to migrate across a membrane in response to either test compounds or natural ligands (i.e., RANTES, MIP-1 β). Cells migrate across the permeable membrane towards compounds with agonist activity. Compounds that are antagonists not only fail to induce chemotaxis, but are

also capable of inhibiting cell migration in response to known CCR5 ligands.

The role of CC chemokine receptors such as CCR-5 receptors in inflammatory conditions has been reported in such publications as

5 Immunology Letters, 57, (1997), 117-120 (arthritis); Clinical & Experimental Rheumatology, 17 (4) (1999), p. 419-425 (rheumatoid arthritis); Clinical & Experimental Immunology, 117 (2) (1999), p.237-243 (atopic dermatitis); International Journal of Immunopharmacology, 20 (11) (1998), p. 661-7 (psoriasis); Journal of Allergy & Clinical Immunology, 100 (6, Pt 2) (1997), 10 p. S52-5 (asthma); and Journal of Immunology, 159 (6) (1997), p. 2962-72 (allergies).

For preparing pharmaceutical compositions from the CCR5 antagonist compounds described by this invention, inert, pharmaceutically acceptable carriers can be either solid or liquid. Solid form preparations 5 include powders, tablets, dispersible granules, capsules, cachets and suppositories. The powders and tablets may be comprised of from about 5 to about 95 percent active ingredient. Suitable solid carriers are known in the art, e.g. magnesium carbonate, magnesium stearate, talc, sugar or lactose. Tablets, powders, cachets and capsules can be used as solid 10 dosage forms suitable for oral administration. Examples of pharmaceutically acceptable carriers and methods of manufacture for various compositions may be found in A. Gennaro (ed.), Remington's Pharmaceutical Sciences, 18th Edition, (1990), Mack Publishing Co., Easton, Pennsylvania.

15 Liquid form preparations include solutions, suspensions and emulsions. As an example may be mentioned water or water-propylene glycol solutions for parenteral injection or addition of sweeteners and opacifiers for oral solutions, suspensions and emulsions. Liquid form preparations may also include solutions for intranasal administration.

20 Aerosol preparations suitable for inhalation may include solutions and solids in powder form, which may be in combination with a pharmaceutically acceptable carrier, such as an inert compressed gas, e.g. nitrogen.

25 Also included are solid form preparations which are intended to be converted, shortly before use, to liquid form preparations for either oral or parenteral administration. Such liquid forms include solutions, suspensions and emulsions.

30 The compounds of the invention may also be deliverable transdermally. The transdermal compositions can take the form of creams, lotions, aerosols and/or emulsions and can be included in a transdermal patch of the matrix or reservoir type as are conventional in the art for this purpose.

35 Preferably the compound is administered orally. Preferably, the pharmaceutical preparation is in a unit dosage form. In such form, the preparation is subdivided into suitably sized unit doses containing appropriate quantities of the active component, e.g., an effective amount to achieve the desired purpose.

The quantity of active compound in a unit dose of preparation may be varied or adjusted from about 10 mg to about 500 mg, preferably from about 25 mg to about 300 mg, more preferably from about 50 mg to about 250 mg, and most preferably from about 55 mg to about 200 mg, according to the particular application.

5 The actual dosage of CCR5 compound employed may be varied depending upon the requirements of the patient and the severity of the condition being treated. Determination of the proper dosage regimen for a particular situation is within the skill of the art. For convenience, the total 10 daily dosage may be divided and administered in portions during the day as required.

15 The amount and frequency of administration of the CCR5 compounds of the invention and/or the pharmaceutically acceptable salts thereof will be regulated according to the judgment of the attending clinician considering such factors as age, condition and size of the patient as well as severity of the symptoms being treated. A typical recommended daily dosage regimen for oral administration can range from about 100 mg/day to about 300 mg/day, preferably 150 mg/day to 250 mg/day, more preferably about 200 mg/day, in two to four divided doses.

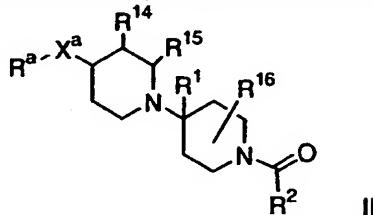

20 The doses and dosage regimens of the NRTIs, NNRTIs, PIs and other agents used in combination with the CCR5 antagonists will be determined by the attending clinician in view of the approved doses and dosage regimens in the package inserts or as set forth in the protocols, taking into consideration the age, sex and condition of the patient and the 25 severity of the condition treated.

30 The goal of the HIV-1 therapy of the present invention is to reduce the HIV-1-RNA viral load below the detectable limit. The "detectable limit of HIV-1-RNA" in the context of the present invention means that there are fewer than about 200 to fewer than about 50 copies of HIV-1-RNA per ml of plasma of the patient as measured by quantitative, multi-cycle reverse transcriptase PCR methodology. HIV-1-RNA is preferably measured in the present invention by the methodology of Amplicor -1 Monitor 1.5 (available from Roche Diagnositics) or of Nuclisens HIV-1 QT -1.

35 While the present invention has been described in conjunction with the specific embodiments set forth above, many alternatives, modifications and variations thereof will be apparent to those of ordinary skill in the art. All such alternatives, modifications and variations are intended to fall within the spirit and scope of the present invention.
